Algorithmic governance: The context

Our world runs on big data, algorithms and artificial intelligence (AI), as social networks suggest whom to befriend, algorithms trade our stocks, and even romance is no longer a statistics-free zone ([Webb, 2013](#)). In fact, automated decision-making processes already influence how decisions are made in banking ([O'Hara and Mason, 2012](#)), payment sectors ([Gefferie, 2018](#)) and the financial industry ([McGee, 2016](#)), as well as in insurance ([Ambasna-Jones, 2015](#); [Meek, 2015](#)), education ([Ekowo and Palmer, 2016](#); [Selingo, 2017](#)) and employment ([Cohen et al., 2015](#); [O'Neil, 2016](#)). Applied to social platforms, they have contributed to the distortion of democratic processes, such as general elections, with 'political contagion', similar to the 'emotional contagion' of the infamous Facebook experiment ([Kramer et al., 2014](#)) involving hundreds of millions of individuals for various political ends, as revealed by the Cambridge Analytica whistle-blowers in 2018 ([Lewis and Hilder, 2018](#)).

This trend is a part of 'algorithmic governmentality' ([Rouvroy and Berns, 2013](#)) and the increased influence of mathematics on all spheres of our lives ([O'Neil, 2016](#)). It is a part of 'solutionism', whereby tech companies offer technical solutions to all social problems, including crime ([Morozov, 2013](#)).

extension of this phenomena. 80 However, for those individuals who did not grow up in that generation or never got into it to begin with, the appeal of Pokémon Go wasn't as predictable or sudden.

smartphones. As of July 2016, on average, children are getting their first smartphones Let's first address the potential effect of the doctrine on young children who have at around age 10,87 For some, children even as young as 7 get their first smartphone 28 In today's society, this is frightening because children at these ages cannot fully appreciate the risks associated with having almost unlimited access to information and the internet.

To add to this, there are children who want to explore different games on these phones by downloading fun and exciting adventure games. As it relates to Pokémon Go, kids are able

to go out with their friends and catch these creatures. However, there are times where these children going out on their own without parental supervision and may find themselves in places or situations they normally wouldn't be, absent a parent or even a smartphone. While it should not be the Developer's responsibility to "parent" every child in the world who plays these games, there should still be some measures taken to ensure that individuals below a certain age need "parental consent" to join or register to play.³⁹ For example, there have been reports that some children playing the game have even wandered into potentially hazardous areas such as

construction sites. ¹⁰

Lastly, what happens if, regrettably, the child becomes a victim of criminal activity?⁴¹ This type of child engagement invites not only danger, but rescue. Ohio also shields adult rescuers if in the course of rescuing a child, they are injured. As such, the adult is treated as a child and is protected. It is safe to say that perhaps this game provides more of an incentive for parents to monitor their children's activity on smartphones, as it applies to new games.

The Developers

Lastly, addressing the creator's potential liability as it relates to the creation of the game, Niantic, Inc., Nintendo, Ltd., and The Pokémon Company while creating an innovative and futuristic style of gaming have also created the risk for personal injury and criminal activity associated with augmented reality gaming. Within the first few weeks of its launch, the Developers have created physical hazards on private property, public streets, and in other public places. As it applies to the Developers, should they be held civilly, and potentially, criminally liable for creating what at times can be described as obvious risks that result from the exercise of the free judgment of individuals who play the game? It would seem that this is a bit of a stretch, as the Developers have created a platform to which people choose to use how they see fit. It would almost be a hindrance on creation if the Developers were to be held liable for each and every activity that arises from people exercising poor judgment.

In response to a variety of strange news stories and reports of criminal activity and personal injury people were experiencing from playing the game, Niantic implemented an auto-generated disclaimer that pops up every time the individual opens the Pokémon Go game on their phone, warning players "to be aware of their surroundings", "to act in accordance with laws of the city or state you live in", etc. Additionally, users must also agree to the very fine print stating they cannot enter private property without the owner's

permission. Furthermore, Niantic, expressly disclaims that it is not liable for any property damage, injuries, or deaths that result while playing. However, does this seem to general and/or too anticipated if this type of disclaimer needs to be stated? Arguably, they should not be held responsible for the poor decisions made by its users, but on the other hand, it seems as if they predicted that behavior of this type would occur.

Unfortunately, it takes a crazy case to be brought before a court for any sort of decision or analysis to proceed any further.

F. Pokémon Trainers Around the Country Are Now Trespassing on Private Property

The Pokémon Go craze has people committing crimes (even unintentionally) or being a victim of a crime, ranging from trespass, to robbery, stabbing, and even domestic issues with cheating partners. So, what happens when an individual playing the game, finds themselves on private property or public property that is limited to the general public after certain times (e.g. cemeteries)? People are now wandering into yards, driveways, cemeteries, museums, churches, alleys, and even off-limit sites in search of these Pokémon. This has led to prompt warnings that trespassers could be arrested, or even worse, seriously injured for coming into contact with an armed property owner.

Under Ohio's Revised Code § 2911.21, the crime of trespass is a fourth-degree misdemeanor. An individual commits a trespass when they enter the property of another without permission. The only requirement is that the person physically

42 Beatriz Costa-Lima and Mary Hudetz, The 'Pokémon Go' Files: 10 Tales of Trespass, Robbery, Murder and More, INSURANCE JOURNAL, (July 15, 2016), <http://www.insurancejournal.com/news/national/2016/07/15/420198.htm>.

Greater criminality in the banking system as a whole has been ignored ([Monaghan and O'Flynn, 2013](#)) and is increasingly regarded as part of the 'normal' part of financialized societies. This is not to claim that there are no options for the progressive use of big data and AI in the 'fight' against 'crimes of the powerful'. For instance, the Slovenian Ministry of Finance's financial administration is using machine learning to detect tax-evasion schemes and tax fraud ([Spielkamp, 2019](#)), which could be directed towards the most powerful multinational enterprises and their manipulations with transfer pricing. However, predictive policing software has not been used to such ends to the same extent as for policing 'the poor'.

Algorithmic decision-making systems may collide with several other fundamental liberties. Similar to ‘redlining’, the ‘sleeping terrorist’ concept (as discussed above) infringes upon the presumption of innocence. The mere probability of a match between the attributes of known terrorists and a ‘sleeping’ one directs the watchful eye of the state to the individual. Similarly, there is a collision with the principle of legality, that is *lex certa*, which requires the legislature to define a criminal offence in a substantially specific manner.

Standards of proof are thresholds for state interventions into individual rights. However, the new language of mathematics, which helps define new categories such as a ‘person of interest’, re-directs law enforcement agency activities towards individuals not yet considered a ‘suspect’. The new notions being invented contravene the established standards of proof in criminal procedure.

In the specific context of a criminal trial, several rights pertain to the principle of the equality of arms in judicial proceedings and the right to a fair trial. Derivative procedural rights, such as the right to cross-examine witnesses, should be interpreted so as to also encompass the right to examine the underlying rules of the risk-scoring methodology. In probation procedures, this right should entail ensuring that a convicted person has the possibility to question the modelling applied – from the data fed into the algorithm to the overall model design (see the *Loomis* case).

Systems of (semi-)automated decision-making should respect a certain set of rights pertaining to tribunals. That is, the principle of the natural court requires that the criteria determining which court (or a specific judge thereof) is competent to hear the case be clearly established in advance (the rule governing the allocation of cases to a particular judge within the competent court, thus preventing forum shopping), and the right to an independent and impartial tribunal.
